According to the international research organization Global Footprint Network, humanity is consuming natural resources faster than they can be replenished -it would take 1.7 Earths to sustain current global rates of consumption. The global challenges of socio-economic inequalities, climate change, and damage to ecosystems require changes in the behavior of companies, governments, communities, and individuals.

The linear economy, based on the manufacture, consumption, and disposal of basic products following the 'take-make-dispose' plan has become a public concern in recent years. This is due to resource-intensive production processes and the increase in the amount of waste sent to landfill. In recent years, there has been a tendency to emphasize the circular economy that follows the 3R approach: reduce, reuse, and recycle. This approach to waste reduction is a priority for international institutions.

RESOURCES FOR CLIMATE CHANGE:

- Global Warming of 1.5 degrees C
- Empowering everyday people to become activists
- EU Climate Knowledge and Innovation Community
- Measure Ecological Footprint
- Technical climate solutions
- Sustainable textile supply chain
- Student strike on Fridays
- Breakthrough Energy Coalition and Ventures
- Machine Learning for Climate Change
- NASA: Facts around Climate Change
